$[\text{Cr}(\text{ox})_3]^{3-}$ 	D_3		C_s
$\text{P}_4\text{O}_{10}^{-4}$ 	T_d		C_1
B_3H_8 	D_{2d}		$D_{\infty h}$
	C_3		C_i

2. (10) Following is the structure of diborane.

To derive the terminal B-H stretching vibrational modes, 4 terminal B-H stretchings are depicted as following.

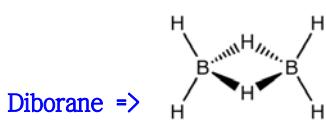

- Find the reducible representation ($\Gamma_{\text{str(B-H)}}$) for the 4 terminal B-H stretchings of the figure.
- Reduce the reducible representation ($\Gamma_{\text{str(B-H)}}$).
- Sketch the Raman-active vibrational modes and identify their symmetry types.
- Sketch the IR-active vibrational modes and identify their symmetry types.

There was a mistake in the structure of diborane.

Either option A or option B is considered as a correct solution.

(Option A)

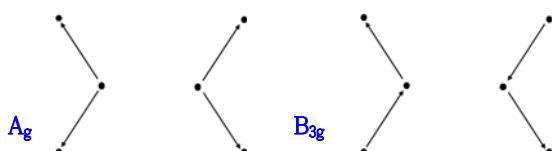

(a) D_{2h}

	E	$C_2(z)$	$C_2(y)$	$C_2(x)$	i	$\sigma(xy)$	$\sigma(xz)$	$\sigma(yz)$
$\Gamma_{\text{str(B-H)}}$	4	0	0	0	0	0	0	4

(b) $\Gamma_{\text{str(B-H)}} = A_g + B_{3g} + B_{1u} + B_{2u}$

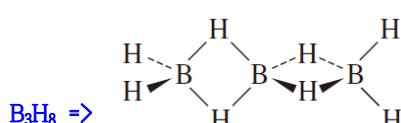

(c) Raman active : $\Gamma_{\text{str(B-H),Raman}} = A_g + B_{3g}$

(d) IR active : $\Gamma_{\text{str(B-H),IR}} = B_{1u} + B_{2u}$

(Option B)

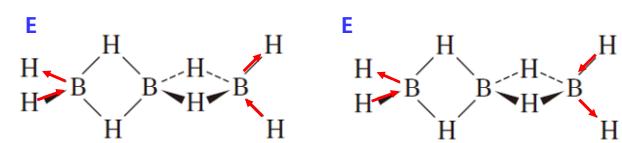

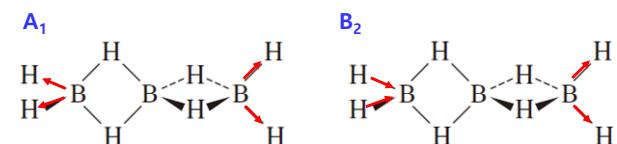

(a) D_{2d}

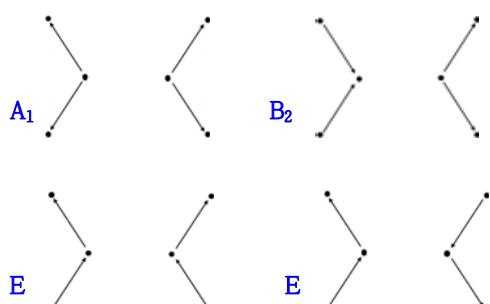

D_{2d}	E	$2S_4$	C_2	$2C_2'$	$2\sigma_d$
$\Gamma_{\text{str(B-H)}}$	4	0	0	0	2

(b) $\Gamma_{\text{str(B-H)}} = A_1 + B_2 + E$

(c) Raman active : $\Gamma_{\text{str(B-H),Raman}} = A_1 + B_2 + E$

or

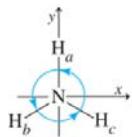

(d) IR active : $\Gamma_{\text{str(B-H),IR}} = B_2 + E$

Sketch : B₂ and E of (c)

3. (15) Following is the method to construct the MOs of NH_3 .
- (a) Derive the group orbitals of three outer H 1s orbitals by using projection operator method. Sketch the group orbitals.
- (b) What are the symmetry types of the valence orbitals of N atom.
- (c) Draw the MO energy level diagram of NH_3 .
- (d) What is the name of LUMO of NH_3 ? Sketch the shape of LUMO.

(a) Point group : C_{3v}

C_{3v}	E	$2 C_3$	$3 \sigma_p$
A_1	1	1	1
A_2	1	1	-1
E	2	-1	0

C_{3v}	E	$2 C_3$	$3 \sigma_p$

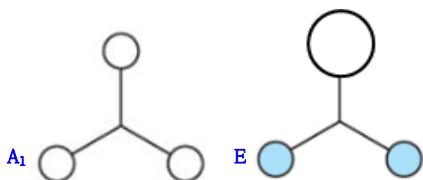

Reducible representation for three outer H 1s orbitals is $\Gamma_{\text{3H1s}} = 3E - 1A_1 + 1E$

< Projection operator method >

	E	C_3	C_3^2	$\sigma_{v(a)}$	$\sigma_{v(b)}$	$\sigma_{v(c)}$
--	-----	-------	---------	-----------------	-----------------	-----------------

H_a becomes by A_1 $H_a + H_b + H_c + H_a + H_c + H_b = 2(H_a + H_b + H_c)$
 by A_2 $H_a + H_b + H_c - H_a - H_c - H_b = 0$
 by E $2H_a - H_b - H_c + 0 + 0 + 0 = 2H_a - H_b - H_c$

Therefore group orbitals for three outer H 1s orbitals is $A_1 + E$.

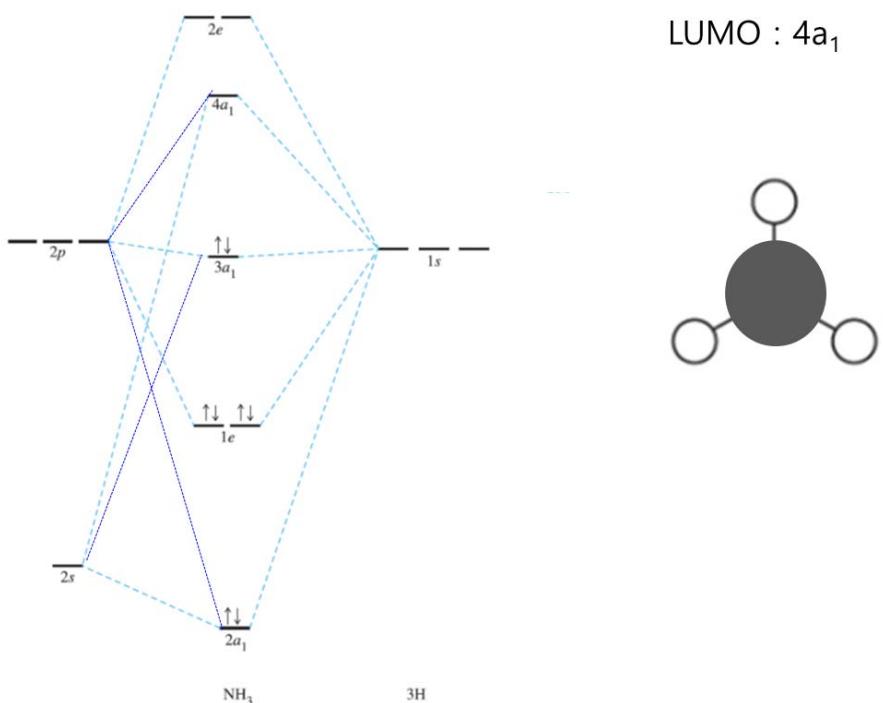

By inspecting the corresponding N atomic orbitals with the same symmetry type, second E group orbital would be

(b) 2s: A_1 , 2p_z: A_1 , 2p_x: E , 2p_y: E
